REC\_DS using C\_Week 7\_COD\_Question 3

Attempt : 1 Total Mark : 10 Marks Obtained : 5

Section 1: Coding

## 1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

### **Input Format**

The first line consists of an integer n, representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string k, representing the contact to be checked or removed.

#### **Output Format**

If the given contact exists in the dictionary:

- 1. The first line prints "The given key is removed!" after removing it.
- 2. The next n 1 lines print the updated contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

If the given contact does not exist in the dictionary:

- 1. The first line prints "The given key is not found!".
- 2. The next n lines print the original contact list in the format: "Key: X; Value: Y" where X represents the contact's name and Y represents the phone number.

Refer to the sample outputs for the formatting specifications.

#### Sample Test Case

Input: 3 Alice 1234567890 Bob 9876543210 Charlie 4567890123 Bob

> Output: The given key is removed! Key: Alice; Value: 1234567890 Key: Charlie; Value: 4567890123

#### Answer

```
void insertKeyValuePair(Dictionary *dict, const char *key, const char *value) {
   strcpy(dict->pairs[dict->size].key, key);
   strcpy(dict->pairs[dict->size].value, value);
   dict->size++;
}
```

```
int doesKeyExist(Dictionary *dict, const char *key) {

for (int i = 0; i < dict->size; i++) {

if (strems(-))
       if (strcmp(dict->pairs[i].key, key) == 0) {
          return i;
       }
     return -1;
  // Remove key-value pair if exists
  int removeKeyValuePair(Dictionary *dict, const char *key) {
     int index = doesKeyExist(dict, key);
   \if (index == -1) {
       return 0;
     for (int i = index; i < dict->size - 1; i++) {
       dict->pairs[i] = dict->pairs[i + 1];
     dict->size--;
     return 1;
  }
  // Print dictionary
  void printDictionary(Dictionary *dict) {
     for (int i = 0; i < dict->size; i++) {
        printf("Key: %s; Value: %s\n", dict->pairs[i].key, dict->pairs[i].value);
       if (i != dict->size - 1) {
          printf(" ");
```
